

Today's poll (about Exceptions)

*Context: The signature for the constructor of the built in Java **URL** class declares that it may throw a **MalformedURLException**, which is a **checked exception***

Consider these four versions of a method – which would compile successfully?

```
// Method A
URL getURL(String address) throws MalformedURLException {
    return new URL (address);
}
```

```
// Method B
URL getURL(String address) throws MalformedURLException {
    try {
        return new URL (address);
    } catch (MalformedURLException ex) {
        return null;
    }
}
```

```
// Method C
URL getURL(String address) {
    try {
        return new URL (address);
    } catch (MalformedURLException ex) {
        return null;
    }
}
```

```
// Method D
URL getURL(String address) {
    return new URL (address);
}
```

Coming up on Friday ...

Discussing solutions to and issues arising from Lab 3

Introducing Lab 4

Lab 4 won't be made available until 1pm Friday because it includes a full solution to Lab 3 as a starting point

Hands-on introduction to Eclipse

“Eclipse 101” handout will be posted on Moodle by end of day tomorrow

If you want to follow along, please make sure that Eclipse is installed on your computer before Friday

I will follow the handout step by step and take any questions during Friday's session
